

Document display with the Adobe Acrobat Reader Browser Plug-in

1. Open the PDF document to be signed using *Document – Choose*.
2. Select under *Signature properties* a signature profile
3. Personalise it pressing the *Edit profile* button. You can change position and size of a visible signature by setting other values in the *Distance from left/top* and *width/height* fields in the *Edit profile* window.
4. Leave the *Edit profile* window by the *Close* button (settings will be held in memory until you terminate LocalSigner) or use the *Save profile* button to store your settings for the chosen profile permanently. To verify position and size of the signature, check *Show preview* in the main window before signing.
5. Press the button *Sign* in the main window, select the certificate (normally the non-rep) and put into the *Reason* field your reason for signing the document.

Signatures already existing in the document to be signed will be displayed and validated using the Adobe Acrobat Reader Browser Plug-in as a Viewer. LocalSigner works in this mode like a Web-Browser. Drag and drop and drawing the signature box with the mouse are therefore not supported. By the menu *Settings-Configuration* you can switch to the integrated PDF-Viewer if you need these functions.
